Basic Laboratory Safety Training

Through partnership with S2 Learning, CURIE is offering an on-line course on basic laboratory safety training. Practical work in a laboratory can be one the most rewarding experience's in a student's university career.

To ensure their laboratory experience is a safe one, students will need to be aware of:

- The risks that may exist in a university laboratory
- How to manage, reduce and eliminate those risks
- How to respond in the event of a laboratory emergency

This 3 part course provides basic information to assist in the identification and control of hazards, the prevention of incidents and accidents and information on how to respond to potential emergencies that may occur in the lab. The information provided will assist in students working safely in the lab. The development of chemical hygiene procedures and protocols, determining and limiting exposure to hazardous elements, the provision of training, and the requirements for personal protective equipment, record keeping and incident/accident reporting are not only exercises in "due diligence" but also legislated by most federal/provincial occupational health and safety regulations, as well as provincial fire codes.

THE 3 MODULES IN THE COURSE ARE:

- Identifying and controlling hazards
- Preventing laboratory accidents and incidents
- Responding to laboratory emergencies

There are test questions at the end of the course and final grades are awarded. If your university is interested in this on-line course you will first have to designate a contact person who will be the "administrator" responsible for in-house setup and management of the program in terms of distributing user ID's and passwords.

Forward the administrator's contact information, including phone number and e-mail address to John Breen at jbreen@curie.org. You will then receive the start-up package and instructions from S2 Learning.

S2 Learning is a training, performance and safety services company headquartered in South Eastern Ohio. S2's consulting services include learning assessment, instructional design, curriculum development, safety and performance improvement.
